

Wet Well Wizard™

The Remedy for Collection Systems

The Wet Well Wizard™ is the only one-size-fits-all wet well aeration system that has no moving parts, is completely non-corrosive, simple to install, and utilizes no electricity underwater. Installation in 30 minutes, and requires minimal maintenance with a monthly filter cleaning. The Wizard's patented technology consists of a unique set of antipodal bubble cleaving disks inside a confined tube that cuts and shapes large air bubbles into high speed, spinning FOG cutters. For large wet wells (over 10 foot diameter) multiple Wizards operate with the use of a single air generation source.

Designed so that it will not cause the cavitation of pumps and will not become clogged with floating well debris. The air source is an industrial grade regenerative blower that can be supplied with stainless steel components if desired, as well as a weather cover or silencing enclosure, although total blower noise level is rated at 68 dB.

- Dissolves fog within hours
- Eliminates H₂S odors
- Eliminates the septicity of H₂S in the wet well and downstream
- Transforms the microbial population in the wet well to a completely aerobic population
- Improves collection system water quality, nearly pre-processing the water, improving wastewater plant operations
